Cell Line Name	WIBR3				
WiCell Lot Number	WB69008				
Provider/Client	Whitehead Institute	Whitehead Institute			
Banked By	WiCell				
Thaw and Culture Recommendations	WiCell recommends thawing 1 vial into 01 medium and MEF. WiCell recommer best results.				
Protocol	WiCell Feeder Based (MEF) Protocol 0	1 for Culture of MJFF iSCORE Lines			
Culture Platform Prior to Freeze	Medium: iSCORE 01 medium	Matrix: MEF			
Passage Number		p30 Cells were cultured for 29 passages prior to freeze post colony selection. Plated cells at thaw should be labeled passage 30.			
Date Vialed	08-July-2025				
Vial Label	WIBR3 p30 WB69008 Store at -135C or colder Made in United States Research Use Only				
Biosafety and Use Information	Appropriate biosafety precautions should be followed when working with these cells. The end user is responsible for ensuring that the cells are handled and stored in an appropriate manner. WiCell is not responsible for damages or injuries that may result from the use of these cells. Cells distributed by WiCell are intended for research purposes only and are not intended for use in humans.

Limitations: This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per haploid genome. It is documented here as "band level", i.e., the range of bands determined from the four karyograms in this assay. Detection of heterogeneity of clonal cell populations in this specimen (i.e.,mosaicism) is limited by the number of metaphase cells examined, documented here as "# of cells counted".

STR Amplification Date: 09Sep25

<u>Assay Description:</u> Short Tandem Repeat (STR) analysis is performed using the PowerPlex® 16 HS System by Promega[™]. Results are reported as 13 CODIS STR markers, Amelogenin for sex determination and two low-stutter, highly discriminating pentanucleotide STR markers.

<u>Results:</u> The genotypic profiles comprise a range of 26-28 allelic polymorphisms across the 15 STR loci analyzed. Samples 108863, 108953, 108780, 108776, 108861 and 108864 are a 100% match to each other and to 108862, 108816, 108815, 108777, 108755, 108624, 108613, 108572, 108571, 108531, and additional profiles. Additional matches can be provided upon request.

<u>Interpretation:</u> The concentration of DNA required to achieve an acceptable STR genotype (signal/ noise) was equivalent to that required for the standard procedure (~1 ng/amplification reaction) from human genomic DNA. These results suggest that the cells submitted correspond to the cell lines as named and were not contaminated with any other human cells or a significant amount of mouse feeder layer cells.

<u>Sensitivity:</u> Sensitivity limits for detection of STR polymorphisms unique to either this or other human cell lines is ~2-4%.
