

Certificate of Analysis

Thaw and Culture Details

Cell Line Name	STAN223i-509C3	
WiCell Lot Number	DB44168	
Provider/Client	Stanford University – Laboratory of Dr. Thomas Queternous	
Banked By	Icahn School of Medicine at Mount Sinai Stem Cell Core	
Thaw and Culture Recommendations	WiCell recommends thawing 1 vial into 5 wells of a 6 well plate using mTeSR™ Plus and Matrigel®. WiCell recommends passaging with ROCK Inhibitor	
Protocol	WiCell Feeder Independent Pluripotent Stem Cell Protocol	
Culture Platform Prior to Freeze	Medium: mTeSR™ 1	Matrix: Matrigel®
Passage Number	p12 Cells were cultured for 12 passages after colony picking prior to freeze. Plated cells at thaw should be labeled passage 13.	
Date Vialied	19-AUGUST-2015	
Vial Label	ISMMS 509i C3P12 AP 081915	
Biosafety and Use Information	Appropriate biosafety precautions should be followed when working with these cells. The end user is responsible for ensuring that the cells are handled and stored in an appropriate manner. WiCell is not responsible for damages or injuries that may result from the use of these cells. Cells distributed by WiCell are intended for research purposes only and are not intended for use in humans.

Date Reported: Friday, June 24, 2022

Cell Line: STAN223i-509C3-DB44168

Submitted Passage #: 14

Date of Sample: 6/15/2022

Specimen: Human iPSC

Results: 47,XY,+i(12)(p10)[17]/46,XY[2]

Cell Line Sex: Male

Reason for Testing: LOT_RELEASE

Investigator: WiCell Stem Cell Bank, WiCell

Nonclonal findings: 47,XY,+18

Cell: 8

Slide: G02

Slide Type: Karyotype

Total Counted: 20

Total Analyzed: 8

Total Karyogrammed: 4

Band Resolution: 450 - 500

Interpretation:

This is an abnormal karyotype. There is an additional isochromosome of the short (p) arm of chromosome 12 in seventeen of twenty cells examined. This imbalance results in four copies of chromosome 12p. Gain of chromosome 12p is a recurrent acquired abnormality in pluripotent stem cell cultures. No other clonal abnormalities were detected at the stated band level of resolution.

There is a nonclonal finding, listed above. Nonclonal findings may result from technical artifact, but may be due to a developing clonal abnormality or to low-level mosaicism.

Limitations: This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per haploid genome. It is documented here as "band level", i.e., the range of bands determined from the four karyograms in this assay. Detection of heterogeneity of clonal cell populations in this specimen (i.e., mosaicism) is limited by the number of metaphase cells examined, documented here as "# of cells counted".

This assay was conducted solely for listed investigator/institution. The results of this assay are for research use only. Short Tandem Repeat

Form SOP-89.01
Version 8.0

Requestor: WiCell Stem Cell Bank, WiCell
Samples Received: 16Jun22, 15Jun22, 14Jun22, 13Jun22
STR Amplification Date: 22Jun22

Assay Description: STR analysis is performed using the PowerPlex 16 HS System by Promega™. Results are reported as 13 CODIS STR markers, Amelogenin for gender determination and two low-stutter, highly discriminating pentanucleotide STR markers.

Results: The genotypic profiles comprise a range of 24-28 allelic polymorphisms across the 15 STR loci analyzed.

Interpretation: The concentration of DNA required to achieve an acceptable STR genotype (signal/ noise) was equivalent to that required for the standard procedure (~1 ng/amplification reaction) from human genomic DNA. These results suggests that the cells submitted correspond to the cell lines as named and were not contaminated with any other human cells or a significant amount of mouse feeder layer cells.

Sensitivity: Sensitivity limits for detection of STR polymorphisms unique to either this or other human cell lines is ~2-5%.

Matches: Samples 92553 and 92481 are 100% match to each other and to 84552, 84553, 84656, 84930, 84931, 84932, 86113, 89607, 90917, 90918 and additional profiles. Additional matches can be provided upon request.

¹Allelic Imbalance: Allelic imbalance was observed in sample 92556 and 92501 at the Amelogenin loci. This could be the result of chromosomal gains, losses, and/or amplifications in the cell line.

²Allelic Imbalance: Allelic imbalance was observed in sample 92545 at the vWA loci. This could be the result of chromosomal gains, losses, and/or amplifications in the cell line.
