**Reason for Testing:** lot release testing

**Passage#:** 13

**Date of Sample:** 8/29/2018

**Investigator:** [REDACTED], WiCell

**Specimen:** Human IPS

**Results:** 46,XY,t(8;9)(p21.1;q22.1)[20]

**Cell:** 7

**Slide:** G02

**Slide Type:** Karyotype

**Total Counted:** 20

**Total Analyzed:** 8

**Total Karyogrammed:** 4

**Band Resolution:** 425 - 500

**Interpretation:**

**This is an abnormal karyotype. Twenty of twenty cells examined contain an apparently balanced translocation between the long (q) arm of chromosome 8 and the long arm of chromosome 9. No other clonal abnormalities were detected at the stated band level of resolution. No normal cells were observed.**

**Comparison of this karyotype with the karyotype of the source (parental) specimen may be informative regarding the significance and origin of the apparently balanced translocation.**

*Limitations: This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per haploid genome. It is documented here as "band level", i.e., the range of bands determined from the four karyograms in this assay. Detection of heterogeneity of clonal cell populations in this specimen (i.e., mosaicism) is limited by the number of metaphase cells examined, documented here as "# of cells counted".*

*This assay was conducted solely for listed investigator/institution. The results of this assay are for research use only. **Results:** Based on the 13789-STR DNA submitted by WiCell QA dated and received on 09/04/18, this sample (Label on Tube: 13789-STR) defines the STR profile of the human stem cell line MCW067i-40001036 comprising 25 allelic polymorphisms across the 15 STR loci analyzed.

**Interpretation:** No STR polymorphisms other than those corresponding to the human MCW067i-40001036 stem cell line were detected and the concentration of DNA required to achieve an acceptable STR genotype (signal/ noise) was equivalent to that required for the standard procedure (~1 ng/amplification reaction) from human genomic DNA. This result suggests that the 13789-STR sample submitted corresponds to the MCW067i-40001036 stem cell line and was not contaminated with any other human stem cells or a significant amount of mouse feeder layer cells.

**Sensitivity:** Sensitivity limits for detection of STR polymorphisms unique to either this or other human stem cell lines is ~2-5%.
