This is a normal karyotype; no clonal abnormalities were detected at the stated band level of resolution.

Limitations: This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected
is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per
haploid genome. It is documented here as "band level", i.e., the range of bands determined from the four karyograms in this assay. Detection of heterogeneity of clonal

## **Short Tandem Repeat**

Form SOP-89.01 Version 3.0

Requestor: WiCell Stem Cell Bank, WiCell Samples Received: 30Mar21, 05Apr21 STR Amplification Date: 06Apr21

**Results:** The genotypic profiles comprise a range of 26-27 allelic polymorphisms across the 15 STR loci analyzed.

<u>Interpretation:</u> The concentration of DNA required to achieve an acceptable STR genotype (signal/ noise) was equivalent to that required for the standard procedure (~1 ng/amplification reaction) from human genomic DNA. These results suggests that the cells submitted correspond to the cell lines as named and were not contaminated with any other human cells or a significant amount of mouse feeder layer cells.

Sensitivity: Sensitivity limits for detection of STR polymorphisms unique to either this or other human cell lines is ~2-5%.

<sup>1</sup><u>Triploid Genotype:</u> A triploid genotype was detected at the FGA loci of sample 85501. This observation could be the result of chromosomal gain, loss, and/or amplification in this cell line.
